

NEW GOLD MINE

GOLDEN OPPORTUNITY ~ INVESTORS WANTED - LIMITED NUMBER OF INVESTORS ACCEPTED

Regent Investment Advisors Inc. is pleased to introduce a rare investment opportunity in the precious metal mining industry. Mingo Affiliates Services Inc has two gold mines where significant deposits of gold ore reserves have been discovered in the mineral rich West African Country of Senegal. The geological studies and research was conducted by Dr. Cheikh T. Diop, Dr. Diop has a doctorate in geology, mineralogy, and mining engineering. The results of the geochemistry, sampling and testing are as follows: The geochemical background of laterites is less than 10 ppb (0.01 ppm or g / t). Whereby all results equal or superior to

0.02 ppm (g / t), can be considered anomalous. 20 of the 22 samples taken from the exploited pits of artisanal miners, provide greater than 1 g / t. 4 successive values are more than 50 g / t (see figure 1 A). The average grade of the gold quartz vein is 48.39 g / t. The lab testing and controls were conducted by the SGS Bamako Laboratory in Mali. The geochemical sampling began on January 19th, 2014 by the opening of additional access tracks to facilitate the movement on the ground and thus greatly reduce the time of operations. It was preceded by the organization of two meetings of consultation (January 15th and 18th, 2014), with the participation of the consulting geologist, the prospecting geologist and the laboratory assistant. In 16 days, 517 samples of soil and laterites were collected. The SGS Analab truck from the Bamako Laboratory retrieved the samples on February 20th, 2014. Mr. Lamine Sy, Head of the Department of Industry and Mines in Kedougou conducted a tour of the perimeter of the mines during the geochemical sampling.
